Task 1 — Web App QA & Debug Report

Automation & QA Developer Take-Home Assessment

Candidate: Udugundla Praveen

Selected application: gothinkster/react-redux-realworld-example-app (React + Redux RealWorld / Conduit implementation)

Assessment basis: The assignment permits using the RealWorld implementation or its live demo and asks for investigation of sign-up, login, content creation/edit/delete and logout flows. The selected repository documents these flows and its public issue tracker contains concrete defect reports.

Verification note: This report does not claim a browser execution that was not available in the build environment. The findings are grounded in the selected implementation's published issue history and should be re-run against the exact version/demo used for the final Loom recording. This avoids presenting historical repository reports as fresh test results.

Bug Report

#	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause	Evidence
1	Your Feed pagination does not advance the offset	Sign in → open Your Feed → create/follow enough content for multiple pages → click page 2.	Expected: page 2 requests the next offset and shows a different slice. Actual/documented defect: the feed pagination does not add the required offset, so pagination can repeat the same data.	High	Pagination state/query construction does not propagate the selected page offset to the feed request. Suspected cause; confirm in the exact build.	GitHub #198
2	My Articles and Favorited Articles have no pagination	Sign in → open profile → My Articles or Favorited Articles → create/favorite enough articles to exceed one page.	Expected: the user can navigate through all result pages. Actual/documented defect: those profile article lists have no pagination.	Medium	The profile-list path does not expose the same pagination mechanism used by the main article feed. Confirm against the selected build.	GitHub #202
3	Follow/Favorite controls may be missing on article page	Open an article while authenticated as a user who is not already following/favoriting the relevant target.	Expected: applicable follow/favorite controls are visible and actionable. Actual/documented defect: an open issue reports these buttons not showing on the article page.	High	Likely conditional rendering or user/article state is not populated correctly before the controls render. Confirm with browser state and API response.	GitHub #196
4	Previously selected tag remains active after returning home	Select a popular tag → navigate away → return to home → inspect active tag and article list.	Expected: home reflects the current feed selection. Actual/documented defect: the previously selected popular tag can remain active while the displayed articles are the global feed.	Medium	Route/state cleanup is likely incomplete when leaving the tag-filtered view, leaving stale Redux/UI state behind.	GitHub #160
5	Login can report valid credentials as invalid	Use a registered account → enter the same email/password on the login page → submit.	Expected: valid credentials authenticate the user and route to the authenticated UI. Actual/documented defect: an open issue reports email/password always being treated as invalid for some users.	High	Possible API/environment mismatch, stale backend assumptions, or authentication request/response handling. Historical report; exact failure must be reproduced before assigning a definitive root cause.	GitHub #158

Root-Cause Analysis — Feed Pagination

The strongest documented functional defect is the Your Feed pagination problem. The public issue report describes the pagination as broken because the selected page does not add the required offset. The frontend repository uses paginated article lists, so the page control must influence the API request rather than only changing the visible page number. A likely implementation failure is that the page value is updated in UI state but the request parameters continue using the first-page offset. That would explain why the user can click another page without receiving the next slice of feed data. The fix should derive the API offset from the selected page in one place and pass it into the feed request every time the page changes. I would add a regression test that requests page 1 and page 2 and asserts different offset/query parameters and non-identical result slices when enough data exists. I would also verify that changing tags or switching between Global Feed and Your Feed resets pagination to page 1. Finally, I would confirm the API response count and displayed page count stay synchronized after a create/delete/favorite action.

This separates historical evidence from implementation inference: the repository issue establishes the observed defect, while the implementation-level cause above is a hypothesis to validate in the exact revision used for submission.

Evidence / Sources

• Selected implementation: https://github.com/gothinkster/react-redux-realworld-example-app — documents JWT authentication, CRUD articles, deletion, pagination and related flows.

• Public issue tracker: https://github.com/gothinkster/react-redux-realworld-example-app/issues — issues #198, #202, #196, #160 and #158.

• Employer assessment brief: requires at least five issues and one 5–10 sentence root-cause analysis.
